Applicant(s)

ISHII, HIROTOMO

Examiner

Colin M. LaRose

Art Unit

2623

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 26 January 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-12 and 22-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-12 and 22-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Arguments and Amendments

1. Applicant's amendments and arguments filed 26 January 2005, have been entered and made of record.

Claim Objections

2. In view of the amendment to claim 7, the previous claim objection has been withdrawn.

Response to Amendments and Arguments

3. Regarding independent claims 1, 8, and 12, Applicant argues that Huang does not disclose the claimed first condition on "absolute positions." Applicant asserts that Huang teaches that pixels are selected "based on their relative position to a target pixel, not with respect to an absolute location." See Applicant's Remarks, p. 8. Examiner disagrees with this contention.

As pointed out in the previous Office action, Huang discloses subsampling the image in order to generate a reduced resolution version of the original. See block 41, figure 4. As is well-known in the art, sub-sampling entails transforming an image by selecting a subset of pixels contained in the image. The resulting set of pixels constitutes a reduced version of the original image. For example, subsampling the image by discarding every second pixel would reduce the image in half; discarding every third pixel would reduce the image by a third; and etc. As in conventional in subsampling, the maintained pixels are spaced at regular intervals throughout the image. It can therefore be said that the absolute positions of the maintained pixels are fixed with respect to the edge of the image; the positions of the maintained pixels do not depend on the location of target pixels or the like – the pixel positions are fixed and spaced at regular intervals.

Art Unit: 2623

This is in accordance with Applicant's depiction of pixels satisfying an absolute condition in figure 5 of the present invention. In figure 5, every third pixel is denoted as meeting the "absolute positional condition"; this is equivalent to subsampling the image to a third of its original size because only a third of the original pixels are kept. Thus, it can be seen that Applicant's "absolute condition," as claimed, directly corresponds to Huang's subsampling operation. Furthermore, Huang's subsampling also anticipates the limitations of newly-added claims 22-24, which require that the absolute positions are fixed with respect to an edge of the image. As explained above, this limitation is found in conventional subsampling.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

5. Claims 1, 2, 6-8, 12, and 22-24 are rejected under 35 U.S.C. 102(e) as being anticipated by U.S. Patent 6,766,056 by Huang et al. ("Huang").

Regarding claims 1, 8, and 12, Huang discloses an image processing apparatus/medium/method (12, figure 1) comprising:

an input unit (scanner 11, figure 1) for inputting image data of an image composed of a plurality of pixels, each having a color data (color image data is input to the pixel buffer pipe 42 via an input device; column 6, lines 19-21);

Art Unit: 2623

a storage unit (42, figure 4) for storing a first condition on absolute positions of pixels in the image and a second condition on positions of pixels relative to a target pixel (first condition: the pixel buffer pipe receive subsampling signals from the sub-sample control module 41 and subsamples the image based on those signals; the resulting image is a down-sampled version of the original that contains only a subset of the original pixels; the pixels to be retained after subsampling constitute the first condition on absolute positions of pixels in the image; see column 6, lines 22-30 and 50-54; second condition: in figure 5, a number of “lag” pixels relative to a target pixel (“0”) are identified; the designation of these pixels constitutes the second condition on positions of pixels relative to a target pixel; see column 6, lines 55-67);

a binarization unit (43, figure 4) for binarizing the target pixel based upon a color data of the target pixel (i.e. target pixel is compared to threshold) and that of at least one related pixel to the target pixel in the image (i.e. related pixels are used to generate the threshold) to generate a binarized value, the at least one related pixel satisfying the first and second conditions stored in said storage unit (column 7, lines 5-25: the threshold for binarizing the target pixel is generated based on the related (lag) pixels, which must satisfy the first and second conditions – that is, the related pixels are present in the subsampled image (absolute condition), and they meet the condition of being “lag” pixels); and

a determination unit (22, figure 2) for determining whether or not the image has a specified pattern, based upon binarized values obtained by said binarization unit (i.e. the mark detection module 22 determines whether a specified patterns exists).

Regarding claim 2, Huang discloses the binarization unit obtains a color data for binarization based upon the color data of the target pixel and that of the at least one related pixel (column 7, lines 12-31: the “color data” obtained for binarization includes the pixel value of the target pixel, and a color threshold that is based on the related pixels), and generates the binarized value based upon whether or not the value indicated by the color data for binarization is within a predetermined range (column 7, lines 20-31 the binarized value of the target pixel is generated based upon whether the target pixel’s color value is within the color range for a designated mark).

Regarding claim 6, Huang discloses the determination unit determines whether or not an image element having a shape similar to the specified pattern exists, based upon the binarized values, and when the image element is determined to exist, finely examines the shape of the image element to determine whether or not the specified pattern exists (column 12, lines 42-55: the mark detector detects circle patterns, and then finely examines those circle patterns by gathering statistical parameters).

Regarding claim 7, Huang discloses that when the image element is determined to exist, the determination unit inhibits to generate an image resembling closely the image received from the input unit (column 21, lines 45-52: e.g. photocopier functions are disabled upon detecting the image element).

Regarding claims 22-24, Huang’s subsampling results in maintaining pixels in the image that are spaced at regular intervals (i.e. fixed with respect to an edge of the image), as is found in conventional subsampling.

Art Unit: 2623

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 4 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Huang in view of U.S. Patent 5,434,953 by Bloomberg.

Regarding claims 4 and 10, Huang discloses subsampling the image in order to reduce the image size, thereby defining a first condition (column 6, lines 22-30), and Huang also discloses a pixel which exists in a straight line including the target pixel extending in the predetermined direction and which is positioned within a predetermined range from the target pixel is the pixel defined in the second condition (figure 5: "lag" pixels, which are positioned within a predetermined range from the target, define the second condition).

Huang does not expressly disclose that every N pixel from a pixel at an edge of the image in a predetermined direction within the image is the pixel defined in the first condition.

However, at the time the invention was made, it was obvious to one skilled in the art that subsampling was typically effected by maintaining every Nth pixel from the edge of the original image in a predetermined direction (e.g. horizontal and vertical directions). Bloomberg teaches that a typical subsampling operation involves dividing an image into square blocks of pixels and then selecting a predetermined pixel from each block. The subsampled image is formed by combining each of the selected pixels, resulting in an image that includes every Nth pixel from the original image.

8. Claims 3 and 9 rejected under 35 U.S.C. 103(a) as being unpatentable over Huang in view of U.S. Patent 5,687,252 by Kanno et al. ("Kanno").

Regarding claim 9, Huang discloses the binarization step includes:

obtaining a color data for binarization based upon the color data of the target pixel and that of the at least one related pixel (column 7, lines 12-31: the "color data" obtained for binarization includes the pixel value of the target pixel, and a color threshold that is based on the related pixels), and

generating the binarized value based upon whether or not the value indicated by the color data for binarization is within a predetermined range (column 7, lines 20-31 the binarized value of the target pixel is generated based upon whether the target pixel's color value is within the color range for a designated mark).

Regarding claim 3 and further in regards to claim 9, Huang does not disclose the color data for binarization is obtained based upon an average value between the value of the color data of the target pixel and that of the at least one related pixel.

Rather, Huang discloses that the threshold is obtained based on only the related (lag) pixels.

Kanno discloses an image processing system that includes the binarization of image data, similar to the system of Huang. In particular, Kanno discloses a number of different binarization processes that may be carried out in order to binarize image data (column 4, lines 1-13). Method (5) involves calculating a threshold based on average values of both a target pixel and related

Art Unit: 2623

pixels (see figure 9 and column 9, lines 65+). The average value of the target pixel and its related pixels within a predetermined range is then used as a threshold for binarizing the target pixel.

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Huang by Kanno to include the target pixel in the calculation of the average value to be used as the threshold, since Kanno shows that calculating the average value based on both the target pixel and related pixels for the purposes of generating a threshold for binarization of a single target pixel is conventional.

9. Claims 5 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Huang.

Regarding claims 5 and 11, Huang discloses storing a third condition defining a position relative to the target pixel in a predetermined direction, and wherein the at least one related pixel includes a pixel satisfying the third condition (threshold determining unit 45, figure 4, stores a threshold, which is a third condition). Huang does not expressly teach that a user specifies the threshold, however, it would have been obvious to those skilled in the art that, as a matter of convenience, a user specifies a threshold used for binarization.

Conclusion

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO**

Art Unit: 2623

MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Colin M. LaRose whose telephone number is (571) 272-7423. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amelia Au, can be reached on (571) 272-7414. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the TC 2600 Customer Service Office whose telephone number is (571) 272-2600.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
